

STC FRAMES

It is not VT's intent to specify the frame installation. As the acoustic door manufacturer, we have to limit the scope of the testing variables. Consequently, the acoustic test report covers only the operable door (door, hardware, and seals).

The information regarding the grout-filled frame is simply one of the test conditions, and the means VT used to insure the transmission loss data was reflective of the operable door. We are unable to provide specific frame installation instructions. It is up to the contractor and acoustic consultant to determine the frame installation that best meets the design and performance requirements.
